MI Windows and Doors has partnered with Slide Works, Inc. in developing a new thermally efficient, multi-slide door with structural performance rating of LC-25. Slide Works specializes in the design and fabrication of sliding door systems and is recognized for its patent pending innovative track system, which allows the Multi-Slide door panels to slide effortlessly along the frame. Interlocking frame components increase ease of operation, function, and installation to promote a complete and integrated frame system.

EnergyCore multi-slide door panels are made with MikronWood and feature tall bottom rails and wide styles with mortise and tenon joinery, offering true traditional style and time-tested craftsmanship. MikronWood is a solid-core material that combines the beauty of wood with the durability, weather-resistant and no-maintenance advantages of a composite. The solid-core material is rot-proof and impervious to insects, moisture, and humidity, making it ideal in all climate types.

The advanced roller system with dual-machined composite wheels and precision bearings perform in tandem with the innovative track to provide a smooth, quiet, and effortless operation.

## Door Panel Color Options

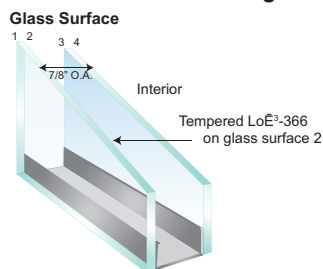

Born from military infrared reflective technology, the SuperCapSR™ color coating is designed to prevent profile distortion due to heat build-up caused by high outdoor temperatures. The co-extruded colorant system creates a molecularly fused color layer that becomes an integral part of the profile and is more durable and scratch-resistant than painted vinyl.

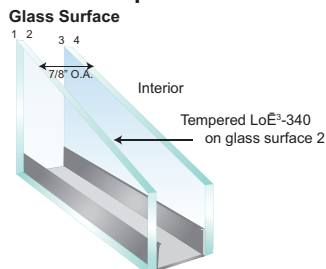

## Glass

The EnergyCore multi-slide patio door features LoE<sup>3</sup>-366 triple silver insulated glass. In warm weather, LoE<sup>3</sup>-366 glass reduces solar heat gain, minimizes interior glare, and lowers inside glass temperature, helping to reduce cooling costs. In cool weather, LoE<sup>3</sup>-366 glass provides outstanding thermal performance with warmer inside glass surfaces to help save energy and maintain comfort during cold winter months.
